CS Impact on Environment

has both positive and negative impacts on the environment as well.

Online reading and publishing

use about 6 billion per year

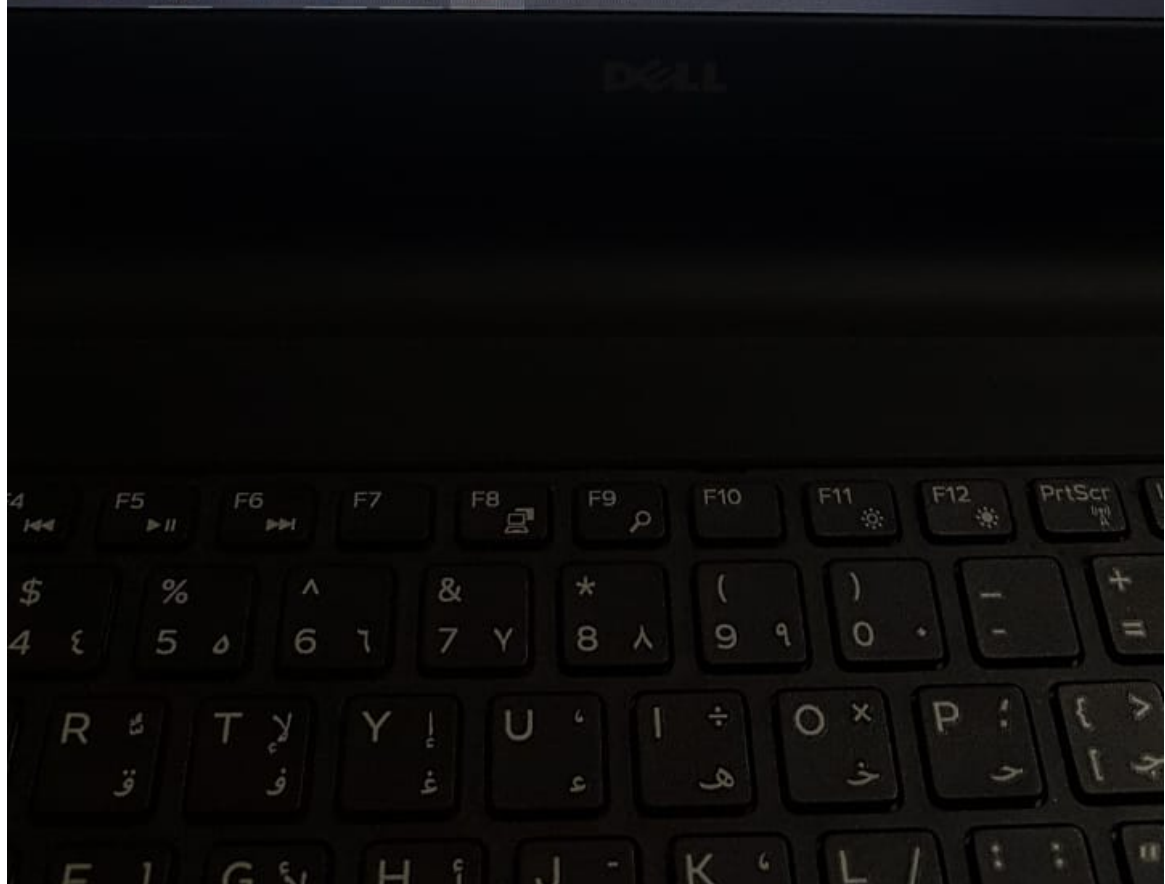

consume about 85 million tons of paper or 2 billion trees.

Each American household throws away 13,000 pieces of paper (around 1 billion trees in SA) each year. Most in the form of packaging and junk.

With the usage of computer, the above waste of trees is minimizing in the world.

However, people print unnecessarily.

Printers are made from heavy metals (Lead, mercury, Beryllium, Cadmium, PCV) when thrown away cause water contamination and air pollution.

Question # 5 of 10 (Start time: 02:40:28 PM, 27 August 2020)

USA has passed legislation allowing the government to actively monitor citizens in the name of

Select the correct option

National ethics

- Paragraph

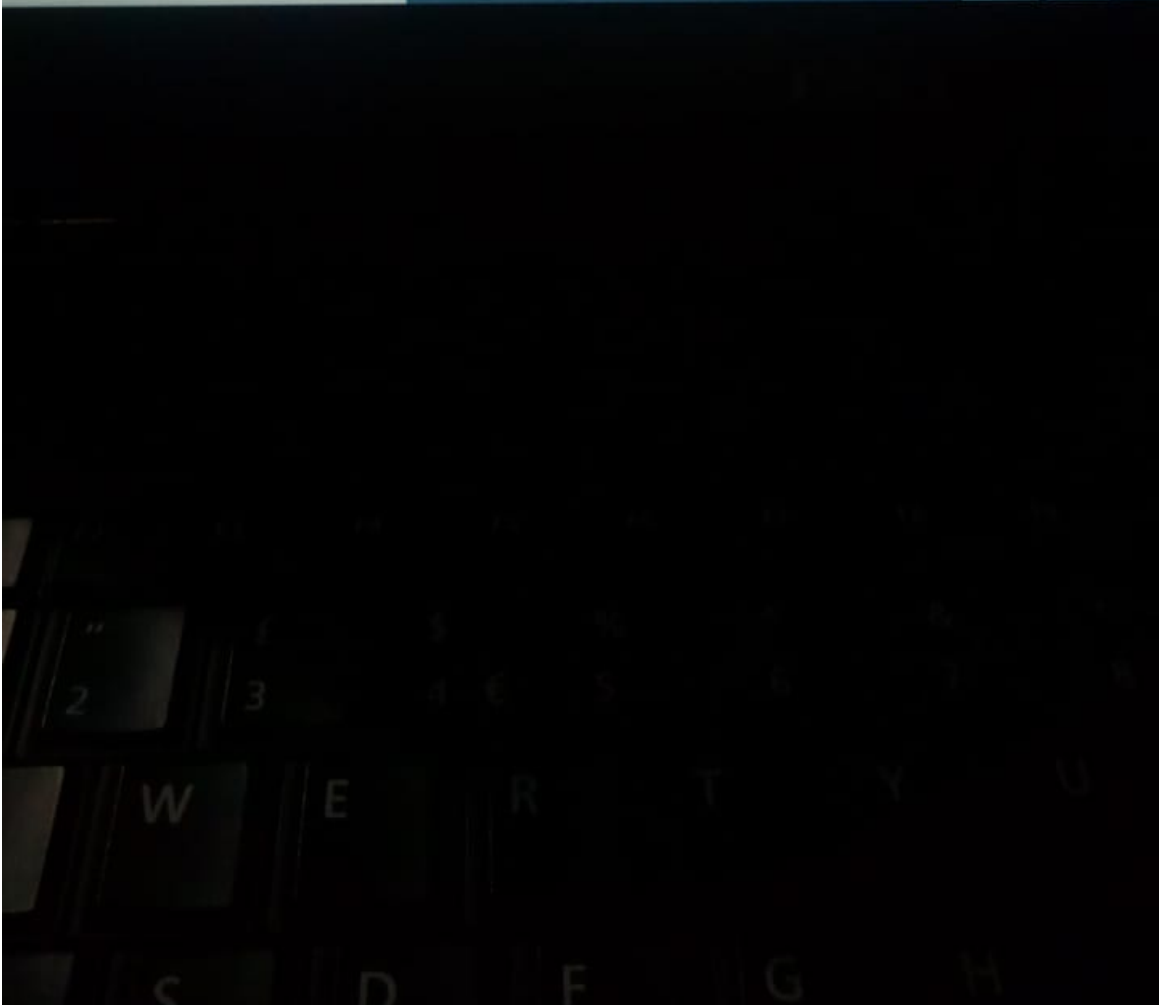

Module 172

172. Artificial Intelligence: Research Methodologies

To appreciate the field of artificial intelligence, it is helpful to understand two research paths. One is the engineering track in which researchers are trying to replicate human behavior. The other is a theoretical track in which researchers are trying to understand the nature of animal—especially human—intelligence. This dichotomy is the manner in which the two tracks are pursued. The engineering approach is an applied methodology because the underlying goal is to produce a product that can be used. The theoretical approach leads to a simulation-oriented methodology because the emphasis is on the understanding of intelligence and thus the emphasis is on the understanding of performance.

As an example, consider the fields of natural language processing and cognitive psychology. They are related and benefit from research in each other, yet the underlying motivations are different. Researchers interested in learning how humans process language and thus tend to lean in the engineering track. Researchers in the field of natural language processing are interested in how to manipulate natural language and therefore lean in the engineering track.

sheet will appear

Tell me more

In the lower right-hand corner of some groups is a small down pointing arrow. This arrow is used to open a **Dialog Expander** or **Launchers**. Clicking on the arrow will open a **Dialog Box**. The dialog box may provide additional options that may not be contained in the ribbon. Dialog boxes that appear should be familiar to many as many are taken directly from earlier versions of the software.

The **Ribbon** has three types of Commands:

- Simple Buttons
- Drop-down menus Buttons
- Launchers (or Dialog Expanders) Buttons

Simple Buttons work as **Toggles** or **on/off switches**. When the command is on, the button is blue and look like all other commands as shown in the Figure 133. When a command is off, the button is grey and be surrounded by orange. A command will only work when it is on. **Bold** text is used to indicate a command that is on.

Question # 10 of 10 (Start time: 06:30:14 PM, 28 August 2020)

The field of linguistics tends towards which direction:

Select the correct option

- | | |
|-----------------------|-------------|
| <input type="radio"/> | Theoretical |
| <input type="radio"/> | Engineering |
| <input type="radio"/> | AI |
| <input type="radio"/> | Business |

is known as region finding. This is the process of identifying those areas in an image that have common properties such as brightness, color, or texture. Such a region probably represents a section of the image that belongs to a single object. (It is the ability to recognize regions that allows computers to add color to old-fashioned black-and-white motion pictures.) Still another activity within the scope of image processing is smoothing, which is the process of removing flaws in the image. Smoothing keeps errors in the image from confusing the other image-processing steps, but too much smoothing can cause the loss of important information as well.

Smoothing, edge enhancement, and region finding are all steps toward identifying the various components in an image. Image analysis is the process of determining what these components represent and ultimately what the image means. Here one faces such problems as recognizing partially obstructed objects from different perspectives. One approach to image analysis is to start with an assumption about what the image might be and then try to associate the components in the image with the objects whose presence is conjectured. This appears to be an approach applied by humans. For instance, we sometimes find it hard to recognize an unexpected object in a setting in which our vision is blurred, but once we have a clue to what the object might be, we can easily identify it.

The problems associated with general image analysis are enormous, and much research in the area remains to be done. Indeed, image analysis is one of the fields that demonstrates how tasks that are performed quickly and apparently easily by the human mind continue to challenge the capabilities of machines.

Module 175

175. Artificial Intelligence: Language Processing

Another perception problem that has proven challenging is that of understanding language. The success obtained in translating formal high-level programming languages into machine language led early researchers to believe that the ability to program computers to understand natural language was only a few years away. Indeed, the ability to translate programs gives the illusion that the machine actually understands the language being translated.

What these researchers failed to understand was the depth to which formal programming languages differ from natural languages such as English, German, and Hindi. Programming languages are constructed from **well-designed** primitives so that each statement has only one grammatical structure and only one meaning. In contrast, a statement in a natural language can have multiple meanings depending on its context or even the manner in which it is communicated. Thus, to understand natural language, humans rely heavily on additional knowledge.

For example, the sentences

Norman Rockwell painted people.

and

Cinderella had a ball.

have multiple meanings that cannot be distinguished by parsing or translating each word independently. Instead, to understand these sentences requires the ability to comprehend the context in which the statement is made. In other instances, the true meaning of a sentence is not the same as its literal translation. For example,

Do you know what time it is?

Often means “Please tell me what time it is,” or if the speaker has been waiting for a long time, it might mean “You are very late.”

To unravel the meaning of a statement in a natural language therefore requires several levels of analysis. The first of these is **syntactic analysis**, whose major component is parsing. It is here that the subject of the sentence

Mary gave John a birthday card. is recognized as *Mary*, while the subject of

John got a birthday card from Mary.

is found to be *John*.

Another level of analysis is called **semantic analysis**. In contrast to the parsing process, which merely identifies the grammatical role of each word, semantic analysis is charged with the task of identifying the semantic role of each word in the statement. Semantic analysis seeks to identify such things as the action described, the agent of that action (which might or might not be the subject of the sentence), and the object of the action. It is through semantic analysis that the sentences “Mary gave John a birthday card” and “John got a birthday card from Mary” would be recognized as saying the same thing.

A third level of analysis is **contextual analysis**. It is at this level that the context of the sentence is brought

though all of these reasons amount to a desire for one's children in their use of digital technology.

We hope and aim to encourage an attitude and approach unnecessary. But how can we make sure that our use of punishment or authoritarian control but is a genuine tool for our kids? One method that's got quite a bit of attention on phone contract.

Another perception problem that has proven challenging is that of understanding language. The success obtained in translating formal high-level programming languages into machine language led early researchers to believe that the ability to program computers to understand natural language was only a few years away. Indeed, the ability to translate programs gives the illusion that the machine actually understands the language being translated.

What these researchers failed to understand was the depth to which formal programming languages differ from natural languages such as English, German, and Latin. Programming languages are constructed from well-designed primitives so that each statement has only one grammatical structure and only one meaning. In contrast, a statement in a **natural language** can have multiple meanings depending on its context or even the manner in which it is communicated. Thus, to understand natural language, humans rely heavily on additional knowledge.

For example, the sentences

Norman Rockwell painted people.

Question # 4 of 10 (Start time: 07:26:56 PM, 28 August 2020)

Style groups in MS-word can have:

Select the correct option

| | |
|-----------------------|-----------|
| <input type="radio"/> | Menus |
| <input type="radio"/> | Slides |
| <input type="radio"/> | Shading |
| <input type="radio"/> | Functions |

Content filtering

Content filtering works by matching strings of characters. When the strings match, the content is not allowed through. Content filters are often part of Internet firewalls. In such a usage content filtering is serving a security purpose. Content filtering is also used to implement company policies related to information system usage. For example, it's common to filter websites like Facebook, youtube etc which are considered unrelated to work.

Content control

Question # 9 of 10 (Start time: 07:37:02 PM, 28 August 2020)

Content filtering is used to implement company policies related to usage of:

Select the correct option

| | |
|-----------------------|--------------------|
| <input type="radio"/> | Online system |
| <input type="radio"/> | Data |
| <input type="radio"/> | Content |
| <input type="radio"/> | Information system |

Correct

Question # 9 of 10 (Start time: 07:28:54 PM, 28 August 2020)

Paragraph group have option:

Select the correct option

| | |

| <input type="radio"/> | Paragraph colour |
| <input type="radio"/> | Shading <i>Correct</i> |
| <input type="radio"/> | Copying |
| <input type="radio"/> | All of these |

Module 164

164. Database Systems: Indexed Files

Sequential files are ideal for storing data that will be processed in the order stored. However, such files are inefficient when records within the file are accessed in much the same way as in a book. In such situations what is needed is a way to identify the location of a particular record. A popular solution is to use an index for the file in much the same way as one would use an index to locate topics within the book. Such a file system is called an indexed file.

An index for a file contains a list of the keys stored in the file along with the location of each key. Thus to find a particular record, one finds the key in the index and then retrieves the block of information stored at the location associated with that key. A file's index is normally stored as a separate file on the same mass storage device as the file. The index is usually transferred to main memory before file processing begins when access to records in the file is required (Figure 120).

A classic example of an indexed file occurs in the context of maintaining employee records. When you are retrieving an individual record, you can be used to avoid lengthy searches when you are retrieving an individual record.

differ from traditional database interrogation in that data mining seeks to identify patterns as opposed to traditional database inquiries that merely ask for the retrieval of data. However, data mining is practiced on static data collections, called **data warehouses**, which are separate from operational databases that are subject to frequent updates. These warehouses are often composed of multiple databases. They are used in lieu of the actual operational databases. Finding patterns in a static system is easier than in a dynamic one.

Question # 8 of 10 (Start time: 07:59:11 PM, 28 August 2020)

Total Marks: 1

Learning procedural knowledge usually involves a process:

Select the correct option

- | | |
|-----------------------|---------------------|
| <input type="radio"/> | Trial-and-error |
| <input type="radio"/> | Try-and-error |
| <input type="radio"/> | Process-and-error |
| <input type="radio"/> | Procedure-and-error |
